From February 24 -28, 1992 an international symposium on Durability of Disease Resistance was held at the International Agricultural Centre in Wageningen, the Netherlands. The symposium, organized by the Department of Plant Breeding of Wageningen Agricultural University and the Centre for Plant Breeding and Reproduction Research, CPRO-DLO, was part of the DGIS funded programme Durable Resistance in Developing Countries. Without any form of prevention or protection nearly all crops will be seriously or even severely damaged by a range of pathogens. In modern agriculture man has been able to control many if not most pathogens using i) pesticides, ii) phyto sanitary methods such as control of seed and plant material in order to start a crop disease free, iii) agronomic measures such as crop rotation, iv) disease resistance or combinations of these measures. Over the years the use of pesticides has increased enormously and so did the problems associated with pesticide use, such as environmental pollution and building of resistance and tolerance to these pesticides in the pathogens. The use of resistance too increased strongly over the years and here

too problems arose.

This volume focuses on integrated pest and disease management (IPM/IDM) and biocontrol of some key diseases of perennial and annual crops. It continues a series originated during a visit of prof. K. G. Mukerji to the CNR Plant Protection Institute in Bari (Italy), in November 2005. Both editors aim at a series of five volumes embracing, in a multi-disciplinary approach, advances and achievements in the practice of crop protection, for a wide range of plant parasites and pathogens. Two volumes of the series were already produced, dedicated to general concepts in IPM and to management and biocontrol of nematodes of grain crops and vegetables. This Volume deals, in particular, with diseases due to bacteria, phytoplasma and fungi. Every day, in any agroecosystem, farmers face problems related to plant diseases. Since the

beginning of agriculture, indeed, and probably for a long time in the future, farmers will continue to do so. Every year, plant diseases cause severe losses in the global production of food and other agricultural commodities, worldwide. Plant diseases are not limited to episodic events occurring in single farms or crops, and should not be regarded as single independent cases, affecting only farms on a local scale. The impact of plant disease epidemics on food shortage ignited, in the last two centuries, deep cultural, social and demographic changes, affecting million human beings, through i. e. migration, death and hunger.

plants all over the world that cause heavy economic losses. It was a challenge to discover weak links in the disease cycle to manage Sclerotinia diseases of large number of crops. For researchers and students, it has been a matter of concern, how to access voluminous literature on Sclerotinia scattered in different journals, reviews, proceedings of symposia, workshops, books, abstracts etc. to get a comprehensive picture. With the publication of book on 'Sclerotinia', it has now become quite clear that now only three species of Sclerotinia viz. , S. sclerotiorum, S. minor and S. trifoliorum are valid. The authors have made an excellent attempt to compile all the available information on various aspects of the fungus Sclerotinia. The information generated so far has been presented in different chapters. After introducing the subject various aspects viz. , the diseases, symptomatology, disease assessment, its distribution, economic importance, the pathogen, its taxonomy, nomenclature, reproduction, reproductive structures with fine details, variability, perpetuation, infection and pathogenesis, biochemical, molecular and physiological aspects of host-pathogen interaction, seed infection, disease cycle, epidemiology and forecasting, host resistance with sources of resistance, mechanism of resistance and other management strategies have been covered.

for numerous reasons - not all caused by diseases. The goal of this work is to help readers separate, for example, leaf spots caused by a disease vs. leaf spots caused by a nutritional deficiency; death caused by a bud rot vs. death caused by lightning; or leaf shredding caused by a disease vs. leaf shredding caused by wind. The ability to determine the cause is critical to selecting successful control measures, which can vastly vary. New to the Compendium of Plant Disease Series, this is a thorough revision of a bestselling palm disease guide first published in 1991 by APS PRESS. This ambitious new treatment of an economically important host is presented in the popular APS Compendium format with new high quality photographs, up-to-date diagnostic and treatment information, and references provided for each topic. An introduction on palm morphology and biology are added in addition to new diseases and enhanced detail. Readers will find data on distribution of pathogens within the United States and worldwide, descriptions of laboratory techniques including information on pathogen isolation and maintenance techniques, a list of potential hosts for each pathogen, and step-by-step treatment methods for diseases and disorders. This book is applicable to any geographic location where palms are grown, whether indoors or outdoors, and will be valuable for a wide range of readers, including nursery growers, extension professionals, plant pathologists, horticulturists, landscape professionals, diagnosticians, arborists, landscape consultants, landscape architects, botanical garden professionals, palm researchers, and palm hobbyists.
