Reflecting the highly interdisciplinary nature of this area, Biomedical Microsystems covers the fundamentals of miniaturization, biomaterials, microfabrication, and nanotechnology, along with relevant applications. Written by an active researcher who was recently named one of Technology Review's Young Innovators Under 35, the book begins with an introduction to the benefits of miniaturization. It then introduces materials, fabrication technology, and the necessary components of all bioMEMS. The author also covers fundamental principles and building blocks, including microfluidic concepts, lab-on-a-chip systems, and sensing and detection methods. The final chapters explore several important applications of bioMEMS, such as microdialysis, catheter-based sensors, MEMS implants, neural probes, and tissue engineering. For readers with a limited background in MEMS and bioMEMS, this book provides a practical introduction to the technology used to make these devices, the principles that govern their operation, and examples of their application. The Convention for the Prevention and Punishment of the Crime of Genocide, adopted by the United Nations General Assembly on 9 December 1948, is one of the most important instruments of contemporary international law. It was drafted in the aftermath of the Nuremberg trial to give flesh and blood to the well-known dictum of the International Military Tribunal, according to which 'Crimes against international law are committed by men, not by abstract entities, and only by punishing individuals who commit such crimes can the provisions of international law be enforced'. At Nuremberg, senior state officials who had committed heinous crimes on behalf or with the protection of their state were brought to trial for the first time in history and were held personally accountable regardless of whether they acted in their official capacity. The drafters of the Convention on Genocide crystallized the results of the Nuremberg trial and thus ensured its legacy. The Convention established a mechanism to hold those who committed or participated in the commission of genocide, the crime of crimes, criminally responsible. Almost fifty years before the adoption of the Rome Statute, the Convention laid the foundations for the establishment of the International Criminal Court. It also obliged its Contracting Parties to criminalize and punish genocide. This book is a much-needed Commentary on the Genocide Convention. It analyzes and interprets the Convention thematically, thoroughly covering every article, drawing on the Convention's travaux préparatoires and subsequent developments in international law. The most complex and important provisions of the Convention, including the definitions of genocide and genocidal acts, have more than one contribution dedicated to them, allowing the Commentary to explore all aspects of these concepts. The Commentary also goes beyond the explicit provisions of the Convention to discuss topics such as the retroactive application of the Convention, its status in customary international law and its future.

Managing Medical Devices within a Regulatory Framework

This volume serves a resource for the design and analysis of neuroprosthetic supersystems, which can be defined as organizations - either small or large, simple or complex - whose human members have been neuroprosthetically augmented. While numerous other texts focus on the biomedical engineering of neuroprostheses as technological devices or on the biocybernetic engineering of the host-device system comprising a neuroprosthesis and its human host, this volume presents a unique investigation of the intentional creation of higher-order supersystems that allow multiple neuroprosthetically augmented human beings to interact with one another and with external information systems in order to accomplish some shared task. In essence, this can be understood as the work of designing and managing neuroprosthetically enhanced organizations. Individual chapters present an ontology of the neuroprosthesis as a computing device; a biocybernetic ontology of the host-device system; an ontology of the neuroprosthesis as an instrument of 'cyborgization'; motivating and inhibiting factors for the organizational deployment of posthumanizing neuroprostheses by military organizations and other early adopters; an introduction to enterprise architecture in the context of technological posthumanization; an exploration of the implications of neuroprosthetic augmentation for enterprise architecture; and considerations for the development of effective network topologies for neuroprosthetically augmented organizations. The conceptual frameworks formulated within this book offer a wide range of tools that can be of use to policymakers, ethicists, neuroprosthetic device manufacturers, organizational

Fundamentals of BioMEMS and Medical Microdevices

Despite enormous advances made in the development of external effector prosthetics over the last quarter century, significant questions remain, especially those concerning signal degradation that occurs with chronically implanted neuroelectrodes. Offering contributions from pioneering researchers in neuroprosthetics and tissue repair, *Indwelling Neural Implants: Strategies for Contending with the In Vivo Environment* examines many of these challenges, paying particular attention to how the healing of tissues surrounding an implant can impact the intended use of a device. The contributions are divided into four sections · Part one examines wound healing from the initial insertion trauma through the inflammatory and repair process, explaining how the action of healing varies throughout different areas of the body. · Part two considers various performance issues specific to particular implant components, including those that arise from the chemical, mechanical, thermal, and electrical impact on surrounding tissues. It discusses challenges that result from chronic tissue stimulation and heat effects that occur with on-chip and telemetric processing. · Part three presents both in vitro and in vivo approaches to assessing wound healing response to materials. It includes the contribution of the developer of a chronic hollow fiber membrane implant who explains how an in vivo model is used to assess molecular transport in brain tissue surrounding the implant. · The final section evaluates molecular and materials strategies for intervening in CNS wound repair and enhancing the electrical communication between the electrode surface and the surrounding tissue. It also presents novel approaches to nerve regeneration and repair. This seminal work provides researchers with an up-to-date account of the progress in the field that they can build upon to bring us closer to realizing the full value of neural implants in combating otherwise intractable human health problems.
