In the 6 years since the publication of the first volume of Recent Advances in Endourology by the Japanese Society of Endourology and ESWL, data on long-term

oncological or functional outcomes have been collected in several related fields, and advances in surgical techniques and improved instrumentation have led to further development of such complex surgery as laparoscopic partial nephrectomy and radical prostatectomy. This seventh volume in the series focuses on the treatment of urogenital malignancies by endourological procedures, including laparoscopic surgery with robotic assistance. The standard procedures and their relatively long-term outcomes as well as new techniques have been clearly described with detailed references. This book provides a better understanding of the present status of endourological management for urogenital carcinoma and sets the stage for future improvements in both oncological and functional outcomes.

India in particular and South-Asia in general have witnessed a rapid increase in the prevalence and incidence of cardiovascular disease over the past 25 years. Lifestyles changes, unhealthy diet, lack of regular physical exercise, and obesity have all led to rising prevalence of metabolic syndrome. It is of no wonder that metabolic syndrome is being increasingly recognized as a clinical entity which is believed to be associated with increased risk of cardiovascular disease beyond individual risk factors, though this is at times debated. This monograph addresses the total nuance of metabolic syndrome in its entirety and answers questions frequently asked on this subject. The authors are internationally respected investigators in their own right having made major contributions in the particular field and are revered teachers as well. The book itself has clear sections which makes it very user friendly and divided into two volumes. The book rightfully deals with management of the syndrome and lays emphases not only on lifestyle measures (which are a cornerstone) but also judicious use of pharmacotherapy and also surgical techniques currently in use.

There are two types of brain tumours: primary brain tumours that originate in the brain and metastatic (secondary) brain tumours that originate from cancer cells that have migrated from other parts of the body. Primary brain cancer rarely spreads beyond the central nervous system, and death results from uncontrolled tumour growth within the limited space of the skull. Metastatic brain cancer indicates advanced disease and has a poor prognosis. Primary brain tumours can be cancerous or non-cancerous. Both types take up space in the brain and may cause serious symptoms (eg: vision or hearing loss) and complications (eg: stroke). All cancerous brain tumours are life threatening (malignant) because they have an aggressive and invasive nature. A non-cancerous primary brain tumour is life threatening when it compromises vital structures (eg: an artery). In the United States, the annual incidence of brain cancer generally is 15-20 cases per 100,000 people. Brain cancer is the leading cause of cancer-related death in patients younger than 35. This new book brings together the leading research in this dynamic area of research.

Peritoneal Surgery addresses the response of the peritoneum to injury and the prevention of post-surgical adhesions resulting from general and gynecologic surgery. Adhesions, or scar tissue binding two normally separate surfaces, form when the peritoneum, the membrane covering the abdominal wall and protecting the inner organs, is damaged during surgery, inflammation, or injury. Negative complications from adhesions include pelvic pain, infertility, intestinal obstruction, multiple surgical complications resulting from surgery to remove or pull them apart, and therefore a greater surgical workload and economic burden to the healthcare system. In this book, experts in the field address peritoneal repair, the role of surgical technique to prevent adhesions, adhesion formation, complications of adhesions, and developing technology in the prevention of adhesions.

Now more than ever, thrombotic and thromboembolic disorders as well as related diseases such as malignancies, arteriosclerosis, diabetes mellitus, hypertension, and obesity are the leading causes of morbidity and mortality. They have become urgent medical problems with serious economic consequences in industrialized and developing countries alike. At the same time, the impact of molecular biology and genetics on our understanding of thrombosis and hemostasis is rapidly growing stronger as well as our knowledge of regeneration and development of specific tissues, organs, and embryos. Researchers are also constantly learning more about cardiovascular diseases as well as regulatory mechanisms for various intrinsic and extrinsic stimuli in viable tissues. In this volume, our intention has been to present the latest relevant information in molecular biology and genetics as well as the clinical implications of a better understanding of pathophysiology, novel diagnostic methodologies, and therapeutic applications for new methods of prevention in thrombosis/hemostasis and related disorders, including atherosclerosis. The dramatic advances in knowledge of thrombosis/hemostasis and vascular biology since the first publication of *Recent Advances in Thrombosis and Fibrinolysis*, edited with Japanese colleagues, in 1991, have required extensive revision in order to highlight and review recent progress in the field. The editors also gratefully welcome the seven distinguished non-Japanese authors, who, with their valuable contributions on subjects beyond the coverage by Japanese authors, have made this new edition truly international.

In 1958; a severely burned steel worker, the extent of whose burns was 890/0 of the body surface, with 20070 of third degree burns, was saved by the Kwangts'e hospital (now the Rui Jin hospital) of Shanghai Second Medical College. It was the first report in the world of such a critically injured patient recovering, and seemed like a miracle at that time. During the 24 following years, a great number of papers reporting the development and advances in burn therapy in clinics and in research showed that Chinese medical investigations in the field of burns have ranked among the most advanced in the world. Plastic surgery, as an independent branch of general surgery, has been established gradually since Liberation. Recently, new techniques, including microsurgical techniques, in plastic surgery have emerged and developed, permitting rapid progress in clinical work and attracting attention and appreciation in other parts of the world. The first national congress of Burns and Plastic Surgery was held from May 16-24 1982 in Shanghai. Over 800 papers were presented and showed how advances have been made in recent years in these two specialities. Here we present selected articles as a symposium. It is hoped that this symposium will be of value to its readers. About the Editor Chang Ti-sheng (Zhang Di-sheng), who was born 12 June 1916, is Professor of Surgery, Shanghai Second Medical College, Shanghai, Chief of the Department of Plastic and Reconstructive Surgery, and Director of Shanghai Ninth People's Hospital, Shanghai.

### **Recent Advances in Metabolic Syndrome - II - ECAB**

ENTERING ON A CREATIVE AND ENTERPRISING PROJECT, DR. DIZEREGA and Rodgers have taken an innovative look at the peritoneum. They have provided an interesting, informative, and stimulating text about an organ that is rarely considered independently-usually being thought of only as a part of other organs or organ systems. The peritoneum is an active membrane that serves as both a secretory organ and a structure that modulates diffusion and osmosis. Both of these important functions are described in great detail. The text is divided in classic fashion. The authors first examine the peritoneal anatomy from both macro and cellular viewpoints, during which exploration it becomes clear that what appears simply to be a lacy covering over abdominal organs actually is a complex structure. Furthermore, during the discussion on its embryologic development the authors make comprehensible the complexity confronting the student of the peritoneum. The authors then proceed to the practicalities associated with this important organ. To surgeons, for example, the key to the peritoneum is understanding the organ's repair mechanism, as it is adhesions formed on the peritoneal surfaces that interfere with the surgeon's hope of success.
